

Laravel Developer for keeno.app

Last Date of submission
14-06-2020

Project based assessment test.
Submit to admin@keeno.app

<http://keeno.app>

Overview

Keeno is a classified platform, a marketplace connecting buyers and sellers through the easy use of technology. In a marketplace where selling of goods is a challenge as well ensuring the visibility and right price for the product, Keeno tries to bridge that gap by connecting sellers and buyers through a simple platform.

We are a couple of ordinary folks, looking for folks better than us, to do some extraordinary work together. We are one of the few product companies in Bangladesh, working on high end technology, to solve a real problem.

Tasks

- 1) We've added a wireframe to the next page - please have a look.
- 2) If you are good at HTML & CSS just follow the mentioned wireframe and create a web page with your own color combination and idea. (Please be creative!)
- 3) Create a laravel project.
- 4) Create 2 database tables (Products and categories) [Write migration]
Products table with fields -- id, title, description, images_url(array of urls), is_featured, category_id, price, rating
Categories table with fields -- id, name, image_url(single image url).
- 5) Create 2 Seeders for 2 tables -- insert more then 4 categories and more then 10 products.
- 6) Show products and categories based on wireframe and your web page design (You have to show these information from database).
- 7) Please try to write clean code, follow best practices as much as you can.
- 8) Try to add sliders to "Featured Products" & "Shop now" section on the wireframe.
- 9) Create a git public repository named "keeno-test". Push your code and share the url with us.

Suggestions

We appreciate your interest here at Keeno. As a process of recruitment, we are trying to recognize your knowledge and practical skills. You can submit completing full or partial but we encourage you to send it all-inclusive. Please follow best practices, psr-2 coding style. If you already know Vue.js you can make it api based if you are not just use laravel blade. Try to give your best effort.

Of-course you can use image_url for products and categories from online, nothing problem with that but please don't just put it blank.

! Good Luck !
